Abstract:

The review paper establishes itself in the arena of AI that is revolutionizing the fitness space nowadays, AI Gym Trainers being the examined part of it. Saliently, such trainers are as virtual coaches that can optimize the process we do with the aid of smart technology. Indoor cycling is rising in popularity because of the number of people who now exercise at home, and with online training as a major reason now. Such AI based trainers optimize instant analytics on our fitness level and provide us with a personalized exercise plan, which for many is suitable because not everybody can afford the wellness gym or be in reach of a personal trainer. AI Gym Trainers are personalized fitness experts that design workouts catered to ones individual characteristics; namely, they take into account their user's unique physical attributes and fitness levels. This personalized guidance is even more helpful in overcoming hurdles such as lack of professional trainers or financial implications concerned with club membership. Traditional fitness clubs use the services of PTs and thus it takes away the concept of training at home, but now we can access teaching directly through our smartphones. Besides that, AI gradually becomes a built-in element of wearable devices, such as smartwatches which function on monitoring an individual's activity level and providing valuable health hints. Besides, another key element is that AI helps prevent injuries as well as to exercise it in the right way. AI Gym Trainers can perform this task by the way of integrating motion-tracking technology that is quite advanced and so, it can analyze the movements of the users in real-time, and provide the feedback in case there is a form problem or an injury risk. This strategy gives an evidence of the focus on well-being and the right undertakings of informing people through advertizing. Overall, the review marks the discreet influence of AI onto the fitness industry by making it more available, personalized and effective to users on a global scale through revolutionization.

1. Introduction:

The fact that AI as a technology is being integrated in the fitness industry will bring in a totally new dimension as to how people can be able to enjoy personalized and accessible workouts. Innumerable research programs prove that the apps with artificial intelligence capability in fitness have a tremendous effect on exercising habits of a person. The apps are innovative in that they give precise recommendations, they do instantaneous feedback, as well as they show unique ways of handling the common never-ending problems that come with the traditional exercises [1] [2] [3] [4] [5]. Mobile apps are built on the basis of AI technologies to allow users to experience virtual personal trainers' interactions and make this activity more attainable by saving personal trainers costs and paying subscriptions to the gym [1]. There are virtual fitness trainer applications available online that make use of artificial intelligence involved in pose estimation with feedback targeted to engaging in safe and right exercises forms [2]. In addition, the progress and achievements in the software development of an Android-based AI trainer can certainly be propagated by focusing on both personalized nutrition and economical affordability through the accessible and reachable platform [3]. Among others, AI works on a deep learning instruction mode to provide guided products and to reduce the risk of injury [4]. Therefore, there exists an app "Trainensor" which is specialized to provide customized exercises and promote live feedback [5]. The goal of this narrative essay on the modern artificial intelligence in the sports domain is to provide a comprehensive picture of the AI-driven fitness applications in terms of their practical purpose, the categories of their end users, the technological basis, and the main limitations.

2. Functionalities:

AI-powdered machines compare to human exercise facilitators, giving the users exclusive features like customized performance and help them perform well without the need for a workout facilitator. One of the applications is the mobile-based one, as well as the web-based one and the Android-based one, enables AI system to allow the end user try virtual training [1] [2] [3].

For instance, the same mobile software calculates BMI and offer workout routine that are personally composed in regard to the BMI of the user. This shall allow giving instantaneous response of exercise execution and it may realize through doing motion tracking with image/video processing technology [1]. Firstly, the virtual fitness trainer using the internet employs AI powered pose estimation and feedback based on poses with the BlazePose technology that provides real time guide on precise moves [2]. A Fitness AI trainer on an Andord-based programby focusing on affordability and accessibility also offers similar features like an exercise tracker [3].

To the technical side, Deep Learning-based approaches are used for squat analysis and correction that are more effective specifically MediaPipe can be adopted for pose estimation. The application measures squatting motion and allows user to practice exercise technique so that it can have lower chance of getting hurt [4]. Moreover, the "Trainensor" fitness app specially displays personalized workouts, live feedback for workout form, advice on correcting posture, and the count of each exercise repetition [5].

The primary roles of AI fitness coaches and virtual fitness trainers are to give us customized or personalized workout suggestions and instructions. Their work is based on computational learning algorithms that analyze user data in order to suggest and advice personalized workouts to individual user [6] [7]. Virtual Trainers may utilize technologies like MediaPipe and OpenCV in real-time pose detection to perform image processing tasks along with delivering feedback during the workout sessions [8] [9].

Therefore, the sporting world undergoes dramatic changes that transformed the way audiences are connected to physical activities by creating customized coaching, ensuring the person's security and making exercising more accessible than ever before.

3. Technological foundations:

AI fitness applications usually possess technological core of various technologies which may range from supplying personalized direction to prompting real time suggestions. As computer technology and machine learning increases, AI algorithms are reconfigured by programmers to add AI as a part of a virtual exercise plan [1] [3] [5]. However, aligning with Apollo decreased the humanization in the company, which made the customers do not feel valued by the product they buy [2]. Although utilizing MediaPipe algorithms have become a popular way of analyzing users statistics to fit them a customized fitness plan, taking into account their goals, preferences, and performances, they are extensively used for posing estimation in virtual fitness training [4]. Initially, mobiles apps apply image and video processing methods, particularly OpenCV library, keeping track of user's actions and describing exercises with a smartphone camera. Moreover, in advanced techniques of machine learning like Convolutional Neural Networks (CNN), movements are determined and provided with feedback based on Body Mass Index (BMI) [1]. Apart from that, another true assistance of AI fitness trainer and the app like "Trainensor" is using AI approach to do pose estimation and feedback making sure the accurate analysis of exercises and leaving you with a personalized advice with real-time feedback even when the technical details are not clear [3] [5].

AI-based application, used for web development by utilising HTML, CSS, and JavaScript simultaneously with BlazePose that is a professional framework from MediaPipe for pose detection and feedback, for tracking of users' movements to make sure they are performing certain exercises properly [2]. Mandatory popularization medium is also used in the framework deep learning of the application for pose estimation with the help of Stacked Bidirectional Gated Recurrent Unit (Bi-GRU) model with the attention layer for precise analysis of squat format [4]. This more intelligent AI technology allows for the identification of types of squat and during in-time corrections to support the safety and the efficacy of the user's workouts [2][4].

Utilizing deep learning's interpretation of complex theory and scientific data passing through the neural networks for analysis the model is able to achieve better understanding. It can adopt a range of deep learning architectures varyingly from CNNs employed for image analysis of sport workouts to RNNs for sequence data, such as workout logs classes [6]. The Ai powered algorithm analyzed by the artificial intelligence virtual trainer used AI technology to assess users' data and give expert guidance. To align with user likes and lift the exercise protocols, the relevant technique is the machine learning [7].

MediaPipe and OpenCV technologies bakes the cake of the interoperable virtual fitness trainer. MediaPipe provides the system with solid key points detection capability and therefore, the system can instantly determine the most important body parts (like head, legs, torso etc.) of the user. OpenCV being an effective tool that facilitates the process because it comes with a rich package of features for image processing and computer vision functions thus it makes hands-on operations like gesture recognition and exercise form analytics possible [8].

By virtue of artificial intelligence (AI) means, the app-based fitness trainer avails the opportunity for specific tasks such as activity identification, pose estimation, and workout classification via machine learning algorithms. Moreover, the system could be designed to export sensor data from cameras, wearable devices, etc., to run instant motion analysis in the real world [9]. This virtual trainer provides you with features like whether there is any mistake in your exercise form while you are practicing, track your progress, or recommend you specific workouts based on your needs. The implementation of AI features could be helpful for example, to give out personal feedback, analyze general data and users' individual goals [9].

The technological infrastructure of AI in fitness applications in terms of using computer vision for posture analysis, human language processing for personalized coaching, and machine learning algorithms to discriminate between activities may be an additional topic. The essay can be elaborated further on AI powered fitness tools like wearable sensors among others are supported by data flow from smartphones and cloud infrastructure [10]. The technological foundations are amply evident; digital fitness applications are developed by utilizing a combination of image and video processing, machine learning algorithms, and advancement in pose estimation techniques. The latter tools are meant to effect practicality and effectiveness while providing personalized assistance to the users.

4. Limitations:

The AI fitness coach, while effective, has inherent limitations.

4.1. Data Dependency: Implementation of AI algorithms is based on huge amounts of labelled data for learning, hence making them unsuitable in places where data is insufficient. Thus, flying in areas with limited data feature becomes complicated for them [6].

4.2. Personalization Challenges: Traditionally, algorithms used a lot of common approaches that may not fully deal with individual requirements and preferences, as a result of that [6].

4.3. Real-World Validation: Lastly, more studies of individuals should be carried out in the environment that the trainers will be used in order for us to verify if virtual personal trainers work well in physical education [7].

4.4. Technical Limitations: While MediaPipe and OpenCV have no doubt computational resources, as well as they can comprehensively identify different pose incorrectly pose estimation inaccuracy it can impact virtual fitness trainers effective [8].

4.5. Data Collection Challenges: High-quality data selection and labeling are good for training AI models, and insufficient recognition of workouts Hermou(reporting) personalized recommendations (is) a problem [9].

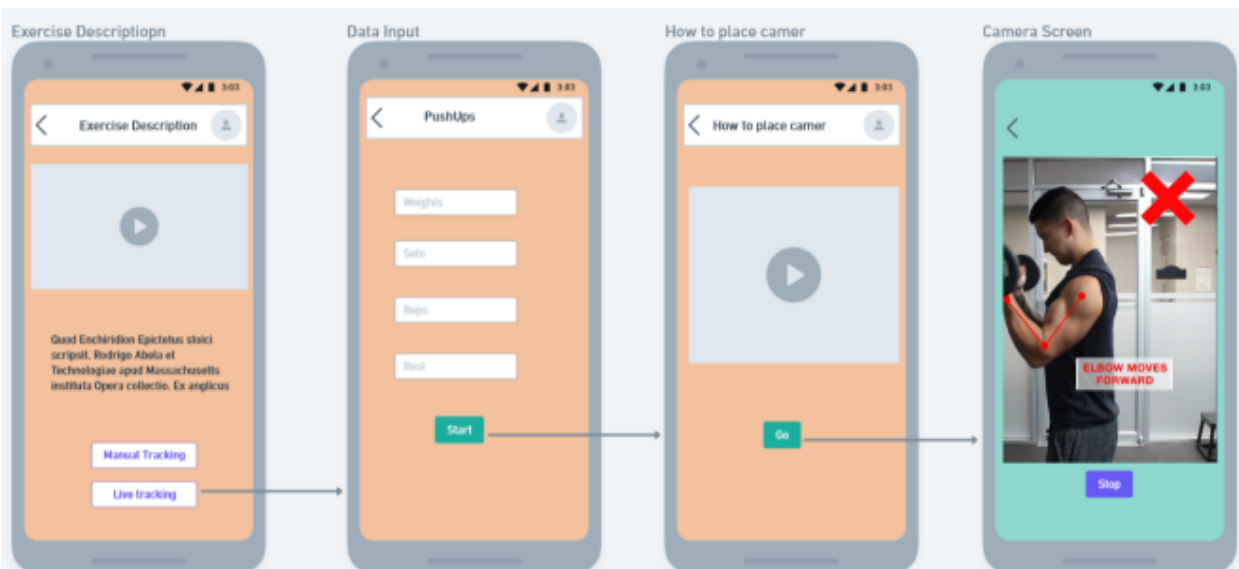

4.6. Dataset Limitations: In an AI environment, the requirements of high-quality and big datasets for training AI models, and the information gathering process that is difficult to accurately interpret from different sensors and data, as well as underlying biases on the recommendation of algorithms, cause AI to fall short [10] [11].

Along with just AI based fitness applications, the AI solutions for personalized training experiences are also some of the key contributions that these fitness technologies make. Nevertheless, some principles are the foundation of those solutions. Notwithstanding using this AI technology for accomplishment of real-time feedback, still, some applications may not match the actuality of human fitness instructors, especially when dealing with more complex exercises as well as in personalized situations, because those cannot always be mastered by AI [1] [3] [5] Moreover, desktop-based virtual trainer and string remote guidance on common exercises but the power of this instruction can be affected by various factors like camera quality or environmental conditions [2]. However, the neural network under development does not properly account for body types different from average or the special cases when the technique or exercise might change [4]. Subsequently, some users may still be disappointed by the app's limited options, mainly those who wished to enjoy a more comprehensive fitness plan [2]. The second thing is that the people who have a low technical proficiency or with less AI structure may have problems to use such sort of complex AI systems [4].

Furthermore, a home fitness app may not possess the ability to examine unique fitness needs or those with specific injuries and require professional supervision, which might impede the application in these situations. Despite the shortcomings highlighted, the basic design flaws and the lack of instincts in AI systems indicate a need for further studies and improvements to make AI more efficient in fitness apps. Nevertheless, the leaps in the understanding of the efficiency of the AI-based health applications have demonstrated some spots to solve and suggested directions for future research as well, which can lead to increase the effectiveness and convenience of those technologies.

5. Enhancement in Fitness Application UX:

The fact that AI of fitness apps feeds UX via provision of customized learning plans, instant evaluation, and recommendations, makes it possible. Apps are successfully bringing change to the workout sector and identifying correctly if you are working out thanks for their use of deep learning models like YOLOv5 [11] [12] [6]. AI algorithms as well as user's dataset such as their age, gender, fitness level and exercise history is examined to provide them with the best choices and make their fitness experience more rewarding [6]. AI fitness apps which offer personalized advice, and suggest workouts or food based on one's preferences, are likely to improve customer experience and engagement [6]. The authentication of AI technology within fitness apps enriches the service and makes it possible for generations of customized and thus more effective training programs.

6. Future Work:

The specific ways in which the investigation and advancement of AI-powered fitness apps may be done vary in the future. However, in the close future, the development of pose recognition can be aimed at the improvement of accuracy and reliability of the technique by using more profound neural networks to serve the functions of instant feedback [1] [5]. The next research direction could then be to enhance the functionality of the program by tailoring the features and content in a way that is aligned with the unique needs of the different user cohorts, such as elderly patients or

individuals with chronic medical conditions [3]. Continuing to the investigation after this will relate the breakthrough into the merging of wearable technology along with artificial intelligence (AI) in order to have a seamless and pulsating experience of a workout plan. Thus, there is a great potential for future research and more work in this area, that will likely lead to the enhancement of these fitness apps' effectiveness, convenience, and users' overall experience. Through the implementation of new algorithms for artificial intelligence (AI), sensor technology and UI design, professionals and researchers can continue even further in the integration of fitness training with these individualized solutions. Overall, this will contribute to the achievement of the health and wellness goals of many more people since they will be able to achieve them through a more successful way. AI-empowered fitness apps may have capabilities to track and to analyze motions of users more accurately and to give more personalized feedback about the user's actions on exercise success through sensors data of wearables devices [2]. Further, it is of extreme necessity that upcoming studies must investigate this issue by realizing randomized controlled trials in order to measure the effectiveness of such applications in assisting workout strategies or fitness outcomes [5]. An additional area worth investigating would be the case of combining AR or VR platforms with AI approaches to evaluate squats [4]. The apps might reinforce the correct form of the exercise and offer graphics and images within virtual environments for the benefit of the trainees. This may increased engagement of the users and adherence to their workout regimens [1] [4] [5].

7. Conclusions:

The prime place for technology-enabled fitness apps is proven that how technology can completely change the way people view fitness as well as exercise. Collecting all, these studies are adding the significant group of data which proves that your apps for mobile phones driven by AI help people in getting their goals. Applying the modern technologies such as posture estimation, machine learning, and live feedback systems, the apps are designed to make the training easier and individualized, which is practical, and efficient for the people who want to get fitter. In addition, there is some area of study and development here that if well implemented could possibly improve the effectiveness and usability of the AI fitness solution as the field broadens, thus creating space for regular people to lead healthy and active lives.
